## EDUCATION

---

- 2024 – 2026     **MTech in Statistics**, Federal University of Technology, Akure (FUTA). CGPA 4.53/5.0; Distinction (expected October 2026)  
Thesis: *Likelihood Approximation Choices and the Performance of Markov-Switching GARCH Models*. Advisor: Prof. Oluwadare O. Ojo
- 2015 – 2021     **BTech in Statistics**, FUTA. CGPA 3.76/5.0; Second Class Upper Division  
Selected coursework: Real Analysis I (B), Real Analysis II (A), Probability Distributions I (A), Stochastic Processes I (A), Statistical Inference I (A), Econometrics (A), Time Series Analysis (A), Bayesian Inference (A), Multivariate Analysis (B)

## RESEARCH PAPERS

---

### Working Papers

- “Likelihood Approximation Choices and the Performance of Markov-Switching GARCH Models: Evidence from Thirty Global Financial Assets,” **J. Ogundairo** and O. O. Ojo. MTech thesis. *Accepted for poster presentation, CFE-CMStatistics 2026, Berlin*.  
Compares four likelihood approximations for Markov-switching GARCH models (Gray’s collapsing, plug-in, Gauss-Hermite quadrature, particle filter) on thirty assets across equity, bond, crypto, derivatives, and FX markets, and develops a kurtosis-based framework for choosing among them. Under standard optimisation the particle filter trails the analytical approximations by 2,000–4,000 log-likelihood units; cross-market spillovers improve fit for bonds and equities but not for FX.  
*My role*: Designed the study and its 220-case experiment, built a C++/Cython likelihood engine (36-fold speed-up), ran all estimation, and wrote the thesis.
- “Impacts of GDP and Debt Servicing on Exchange Rate Volatility of the Nigerian Naira: A Bayesian EGARCH-X Approach,” **J. Ogundairo**, A. A. Adewale, and O. O. Ojo. *In review for bid at the Oxford CSAE Conference, March 2027*.  
Shows that macro-fiscal fundamentals drive the naira’s risk rather than its level. In a Bayesian EGARCH(1,1)-X estimated by NUTS on monthly NGN/USD data (1999–2020), debt servicing raises conditional variance by about 32% per s.d. (95% CrI [0.163, 0.414]) and GDP growth lowers it by about 13%, with a significant leverage effect and a 2.8-month volatility half-life.  
*My role*: Conceived the study, assembled the data, built and estimated the Bayesian model in RStan, and wrote the paper as lead author.

### Publications

- “Forecasting of Crude Oil Prices: A Comparative Time Series Prediction Technique,” O. O. Ojo, A. A. Adewale, and **J. Ogundairo**. *Studies of Applied Economics*, 44(3), 2026.  
Compares GARCH, Support Vector Regression, and LSTM forecasts of daily WTI and Brent prices, showing that the best model depends on forecast horizon and market conditions.  
*My role*: Implemented the GARCH, SVR, and LSTM models in R and contributed to the comparative analysis.
- “Energy-Growth Dynamics in the Presence of Income of 5 Oil-Exporting African Countries: A Time Series Approach,” **J. Ogundairo**, P. T. Oluwadare, and L. Di Gennaro Splendore. *Journal of the Royal Statistical Society – Nigeria Group*, 1(2), 19–43, 2024.  
Finds four structurally different energy-growth causal patterns across five neighbouring oil exporters (1980–2021) using cointegration, VAR/VECM, and Granger causality analysis.  
*My role*: Conceived the study, assembled the WDI and US EIA data, carried out all time series analysis, and wrote the paper as lead author.

## RESEARCH COMPUTING
